

A clip and a pin the night manager can answer — and a PDF the board can keep.

Day camera or night thermal — same chatbot. Your team gets a still or short clip and a pin, chooses Send Team or False Alarm, and keeps the coverage PDF. Licensed local pilots fly. Flight is a separate hire. One pack at a time.

How it works

1. Patrol Day camera or night thermal coverage of your perimeter	2. Detect Person or vehicle events with scene context	3. Alert WhatsApp text, photo or short clip, pin, optional voice	4. Respond Send Team · False Alarm · Last Sighting · ask a question	5. Assist Hold and refresh evidence while your team moves	6. Record Coverage PDF and session history

What your estate receives

A direct contract

You contract RoboAgro. Licensed local pilots fly. You receive the alerts and the record.

Send Team / False Alarm

People stay in control. Buttons replace chaotic threads. Ask a follow-up question on the same chatbot.

Hold and refresh

Aircraft can hold and update location and evidence while your team moves — it does not chase.

Incident & attestation packs

Optional exports for security leads, boards, insurers, and lenders when a stamp is required.

Zones & personnel context

Zone names, sensitivity, and expected presence so alerts reflect who should be where.

Questions on the thread

Ask what was last seen, which zone, or whether the team acknowledged. Same WhatsApp chat.

WhatsApp chatbot

Photo or short clip, GPS pin, buttons, and questions — on the number your team already uses.

Last Sighting evidence

Retrieve the latest still or short clip and pin when the ground team needs a clear picture.

Coverage evidence packs

Board-ready PDF after patrol stop: what was covered, how the team responded, what remains on file.

English & Kiswahili alerts

WhatsApp language matches your ops audience, with optional voice on critical events.

Night thermal security

Twelve night sessions when a thermal-capable aircraft is available. Same chatbot, clips, and questions. Flight extra. One pack at a time.

Same WhatsApp as farm scout

Crop advice can sit beside security on the same number — a different product, not this sheet.

Built for estate owners and security leads who renew coverage on evidence.

Problems this addresses

- **Clips that do not renew.** A video alone is hard to turn into next month's retainer.
- **Scattered WhatsApp threads.** Photos, pins, and decisions get lost without structure.
- **No audit trail.** Boards and insurers need exports, not memory of who saw what.
- **Detection without response.** Alerts stall unless Send Team / False Alarm is clear.
- **Day vs night gap.** Day camera covers daylight; night thermal is the after-dark pack — same chatbot, clips, and questions, one at a time.
- **Flight buried in a platform fee.** Aircraft hire should stay its own line, like any other pilot.
- **Fragmented tools.** Scout, guards, and footage often live on separate timelines.

How it differs

- Manual WhatsApp sends a message. RoboAgro records who flew, what was seen, who acknowledged, and what evidence remains.
- Complements local guards and licensed pilots — humans stay in control.
- Monthly **platform** retainer — about \$350 day camera or \$580 night thermal (USD guide). Aircraft hire is a separate line.
- After you enquire: a visit, then one paid flight, then a retainer. Invoiced in local currency.
